PLASTEC REPORT 25

COMPATIBILITY OF PLASTICS WITH LIQUID PROPELLANTS, FUELS AND OXIDIZERS

**JANUARY 1966** 

**Best Available Copy** 

PLASTEC

PLASTICS TECHNICAL EVALUATION CENTER

PICATINNY ARSENAL DOVER, NEW JERSEY

Authorized by the Office of Director of Defense Research and Engineering, the Plastics Technical Evaluation Center (PLASTEC) evaluates and disseminates technical information on current development, engineering, and application work in the field of plastics and reinforced plastics. It engages in materials surveys and other special assignments, and provides the Department of Defense with technical data and advice on research and development programs on plastics.

Army, Navy and Air Force installations, and contractors and other suppliers of defense needs may request information from this center directly.

PLASTEC documents are distributed automatically to qualified organizations and individuals, according to the stated interest established in its Field of Interest Register (FOIR).

Unless otherwise stated below, PLASTEC reports are available to qualified requesters from the Defense Documentation Center (DDC), Cameron Station, Alexandria, Virginia, 22314; and to the general public through the Clearinghouse for Federal Scientific and Technical Information (CFSTI), 5285 Port Royal Road, Springfield, Virginia 22151.

PLASTEC REPORT 25

# COMPATIBILITY OF PLASTICS WITH LIQUID PROPELLANTS, FUELS AND OXIDIZERS

by

NORMAN E. BEACH

## **JANUARY 1966**

Plastics Technical Evaluation Center
Picatinny Arsenal, Dover, New Jersey

## **ABSTRACT**

Much has been published on the subject of the compatibility of plastics with liquid propellants, fuels and oxidizers, but invariable from the standpoint of the propellant or fuel. This report is a rearrangement of the published compatibility data from the standpoint of the plastic material. It is in the form of a tabulation, with primary arrangement by plastic (or elastomeric) material; and thereunder, by fuel. All arrangements are alphabetical, in the form given in the original reference; that is, either by generic or trade designation. The compatibility evaluation is in terms of the original document, briefly culled to show behavior of the material at a given temperature and for a given time. Elastomers are included (although they are not a stated concern of PLASTEC); but oils, lubricants and greases are omitted, even though based on polymers. The information has been drawn from 43 references, which are annotated so that the information extracted from them shall have additional significance.

Mention of a particular commercial product neither constitutes an endorsement by the Plastics Technical Evaluation Center, nor a voucher for the accuracy of a manufacturer's claim unless specifically noted.

#### SECTION 1. INTRODUCTION

This work had its inception some four years ago, when inquiry was made of the Center for information on the behavior of particular plastics when in contact with liquid propellants. Preparation of a response required search among existing documents, all of which were organized from the standpoint of the propellant or fuel in relation to materials in general. To arrive at even a simple answer, the effort entailed was far out of proportion and the end result could not be expressed in other than general and tentative terms.

With repeated inquiries of this nature, it was decided to convert all available liquid propellant compatibility data to the plastics standpoint; in other words, to convert what the propellant is compatible with to what the plastic is compatible with. In the conversion, in-between compatibility and incompatibility have been included. Thus, this document is an exhaustive effort to tell everything that anyone has published (unclassified) about the particular plastics as they behave in the presence of liquid propellants and related fuels.

Although not within the purlieu of the Center, elastomers were included in the search. However, polymer-based oils, lubricants and greases were passed over, even though the temptation to include them was great. The Center is virtually confined to solid plastic materials studies, or nonsolid materials (resins) on their way to becoming solid plastics.

It is recognized that the perfect report on this subject would contain two parts: from the standpoint of the plastic, and from the standpoint of the fuel. The size of the former (plastic) compilation is so great that it virtually precludes the addition of the latter (fuel) arrangement. This latter would be more of a convenience than a necessity, since the "fuel" arrangement is always available in the published literature, even though scattered.

This search has been confined to unclassified publications, in line with a general policy of the Center - to give its output the possibility of the widest dissemination. This is particularly justifiable in this case, since the classified work is largely confined to fuels under development. It is felt, however, that this rehashing of "old" data may be of particular help to the worker on classified projects.

No report on compatibility is complete without a precautionary note on the use of such data. Compatibility evaluations are only valid for the material studied. Only when a material is tied-down by a manufacturer's identification number, or by a precise and unwavering chemical formulation, can a value approach validity. However, this compilation has definite value for the explorer (as against the user) in that the side-by-side presentation of the findings of a number of investigators has an undentable impact. For example, the finding on "\*\*\*\*\*\*" in contact with 50/50 Fuel blend may be: Class D, decomposed; Grade 3, blistered; Class D, Shore A decrease 25 units; Class C, tensile loss 73.8%, et cetera. On the other hand, "\*\*\*\*\*" may have produced

these evaluations: Class A, no visible change; Grade 1, slight swelling but recovered; Class 2, fuel discolored; et cetera. It can be seen that the bits of information are quite valid, when combined; and that the reader will know what his chances are.

### SECTION 2. ORGANIZATION

The body of this report is a tabulation of the found data under four headings: "Material" (either plastic or elastomer); "Fuel" (propellant, fuel or oxidizer with which the contact was made); "Behavior" (briefly, the kind of reaction which took place at a stated temperature for a certain length of time); and "Reference" (from which the information came).

A great deal of the information found used trade designations for identification of the plastic or elastomeric materials. These have been carried over into this report. In cases in which the trade designation was not further identified by the author of the report or could not be satisfactorily identified at the Center, the item was discarded as of questionable value to anyone. For completeness of reference, the generic name is included for example: Polyethylene - See also "\*\*\*\*\*\*\*, "\*\*\*\*\*\*, and "\*\*\*\*\*\*\*."

The materials are alphabetized within the tabulation, by the given name (either trade or generic, as applicable). Within this frame, the fuels are further alphabetized so that for "\*\*\*\*\*\*\* there will be presented its behavior with Aerozine 50, ammonia, 50, 50 fuel blend, hydrazine, IRFNA, nitrogen tetroxide, oxygen, pentaborane, RFNA, and UDMH (and other fuels, propellants, or oxidizers appropriately alphabetized among these). This secondary organization will help the reader in locating what plastic or elastomer is compatible with a certain fuel, to the extent that it will make it easier for him to scan the "Fuel" column.

The references are those reports from which the data came. These are presented in quite complete form at the end of this report. They are annotated to include the available identification of the materials studied, and the presentation of any special basis for evaluation ("Class" or "Grade" used for certain reactions). A "Comment" section giving the general viewpoint of the work reported is included.

This work has been a long-time side effort of the Center. Consequently, the compilation represents (in some cases) original reports and revisions or later versions (Refs 4 and 4B; Refs 2 and 39). When these as peared, the new facts were evaluated and added to the body of data withcut removal of the older items. Thus, in the "Behavior" cited in this

work, exposures for short term (from original report) and long term (from revised report) will both be given. In the total picture, all bits of information are of value.

The reader will note, in the particular references, that the "Grade" or "Class" evaluations are always in the same directions. That is, the lowest grade or class denotes compatibility ("A" or "1") and the increase in grade or class denotes lessened potential for compatibility ("C" or "3"). This makes scanning of the tabulation easier. However, for exactly what the author meant by the particular grade or class, the reader must turn to the reference.

Support information is presented in the appendixes. Appendix A lists and identifies the trade designations appearing in this report. Appendix B summarizes the liquid propellants, fuels and oxidizers encountered in the search, which are variously mentioned in conjunction with their contact behavior with plastic 3 and elastomers.

## 1. Plastics Technical Evaluation Center

SUGGESTED PLASTIC MATERIALS FOR USE WITH LIQUID PRO-PELLANTS AND RELATED MATERIALS. Inquiry report, unnumbered, by Norman E. Beach, October 1961.

こうしゅうとうからはかっています。

IDENTIFICATION OF MATERIALS; Not specific.

BASIS OF EVALUATION: Generalized statements based on source evaluations.

REMARKS: Early work, which evolved into this report.

2. Defense Metals Information Center, Battelle Memorial Institute

COMPATIBILITY OF ROCKET PROPELLANTS WITH MATERIALS OF CONSTRUCTION. DMIC Memorandum 65, 15 Sept 1960 OTS PB 16125

REMARKS: See reference 39, this report.

3. Office of the Director of Defense Research and Engineering

THE HANDLING AND STORAGE OF LIQUID PROPELLANTS, March 1961

IDENTIFICATION OF MATERIALS: None specific (generic or trade names)

BASIS OF EVALUATION: Most frequently, those materials are listed which are acceptable, preferred, or hazardous to use. Some are classified according to the following:

Class 1: Materials which are highly compatible and can be used for long-time contact. Typical uses for a material of this class would be in constructing long-time storage containers, tank cars or drums.

## REF 3. (Continued)

Class 2: Usable in repeated short-time contact. The time of the limited contact should not exceed 4 hours at 160°F or 1 week at 70°F. Typical uses for materials of this class would be in valves and pumps in a peroxide-transfer line or in high-pressure storage tanks.

Class 3: These materials should be used only for short-time contact. They can be used for repeated contact, but no one period should exceed 1 minute at 160°F or 1 hour at 70°F prior to its immediate use. These materials might contaminate the solution enough to render it unsuitable for storage.

Class 4: These materials are not recommended for any use. They cause the chemical to decompose rapidly, are quickly attacked by it or form explosive mixtures with it.

REMARKS: This manual is published for information. It is intended that it can be used as a basis for the preparation of regulations governing the handling and storage of liquid propellants.

TITAN II STORABLE PROPELLANT HANDBOOK, Final Handbook, June 1961. AFFTC TR-61-32. Prepared by Bell Aerosystems Company; R. R. Liberto, author. Contract AF 04(611)-6079. Report No. 8111-933003.

IDENTIFICATION OF MATERIALS: Available specific identification given at citation in Section 3. (See also Appendix A, for identification of trade names.)

4. (Continued)

#### BASIS OF EVALUATION:

Class A: Satisfactory for service under conditions indicated.

Class B: Use with knowledge that it will swell or shrink and/or change in hardness.

WATER TO THE PARTY OF THE PARTY

Class C: Satisfactory for ground support where preventative maintenance can be scheduled. Also good for actual missile service where slight discoloration of propellant and extracted residue is tolerable.

Class D: Unsatisfactory for use.

REMARKS: Summarized are the physical properties, materials compatibility, handling techniques, flammability and explosivity, and procedures for storing, cleaning, and flushing of the Titan II propellants, N<sub>2</sub>O<sub>4</sub> as the oxidizer and a nominal 50/50 blend of UDMH and N<sub>2</sub>H<sub>4</sub> as the fuel. The data presented was derived both from a literature survey and from a test program

5. Rocket Research Laboratories, Edwards, California

COMPATIBILITY OF MATERIALS..... Technical instructions, RRL TI No. 4-2-1 to RRL TI No. 4-2-13, as follows:

- 5-1 COMPATIBILITY OF MATERIALS GENERAL; RRL TI No. 4-2-1, 1 June 1962
- 5-2 COMPATIBILITY OF MATERIALS WITH OXYGEN; RRL TI No. 4-2-2, 4 June 1962
- 5-3 COMPATIBILITY OF MATERIALS WITH PETROLEUM FUELS; RRL TI No. 4-2-3, 4 June 1962

- 5-4 COMPATIBILITY OF MATERIALS WITH INERT GASES AND LIQ-UIDS; RRL TI No. 4-2-4, 4 June 1962
- 5-5 COMPATIBILITY OF MATERIALS WITH HYDRAZINE FAMILY; RRL TI No. 4-2-5, 4 June 1962
- 5-6 COMPATIBILITY OF MATERIALS WITH BORON HYDRIDE FAMILY; RRL TI No. 4-2-6, 4 June 1962
- 5-7 COMPATIBILITY OF MATERIALS WITH NITROGEN TETROXIDE; RRL TI No. 4-2-7, 22 June 1962
- 5-8 COMPATIBILITY OF MATERIALS WITH HALOGEN FLUORIDE FAMILY: RRL TI No. 4-2-8
- 5-9 COMPATIBILITY OF MATERIALS WITH FLUOROAMINE FAMILY; RRL TI No. 4-2-9, 22 June 1962, TENTATIVE
- 5-10 COMPATIBILITY OF MATERIALS WITH FLUORINE; RRL TI No. 4-2-10, 22 June 1962, TENTATIVE
- 5-11 COMPATIBILITY OF MATERIALS WITH HYDROGEN; RRL TI No. 4-2-11, 22 June 1962, TENTATIVE
- 5-12 COMPATIBILITY OF MATERIALS WITH ANHYDROUS AMMONIA, RRL TI No. 4-2-12, 22 June 1962
- 5-13 COMPATIBILITY OF MATERIALS WITH OXYGEN DIFLUORIDE, RRL TI No. 4-2-13, 22 June 1962, TENTATIVE

IDENTIFICATION OF MATERIALS: General references only, usually; some specific trade materials identified by number and trade-name.

BASIS OF EVALUATION: By a grading system, as follows:

Grade 1. Suitable for general use Grade 2. Suitable for limited use Grade 3. Not suitable for use

REMARKS: Selection of materials for use with particular propellants presents a very grave problem. Improper selection of a material can easily result in a catastrophe. As more types of propellants are used concurrently, the problem becomes more difficult to control; therefore, only approved materials shall be used. This directive is NOT intended to restrict the engineering selection of new materials for use in development hardware but only to assure adequate control over materials to be selected and used on Rocket Research Laboratories in-house test projects.

## 6. Back, A.L. (Catalytic Construction Company, Philadelphia)

"Rubber and plastics for process plants", in MECHANICAL ENGINEERING, October 1963, p. 47-50

IDENTIFICATION OF MATERIALS: No specific materials mentioned; information on generic families.

BASIS OF EVALUATION: General statements of how used and chemical resistance.

REMARKS: Tables are excellent for general reference.

#### 7. G. T. Schjeldahl Company

EVALUATION OF THE COMPATIBILITY OF POLYVINYLIDENE FLUORIDE (KYNAR) WITH STORABLE LIQUID PROPELLANTS (NITROGEN TETROXIDE AND HYDRAZINE), by H. J. Fick. Prepared for Jet Propulsion Laboratory, Contract No. N1-120421, 30 January 1963.

IDENTIFICATION OF MATERIALS: Polyvinylidene fluoride available as Kynar from Pennsalt Chemical Company. Other materials not specifically identified.

BASIS OF EVALUATION: Statement of physical characteristics after storage. No adjectival evaluation, as such. The performance of the Kynar was considered to be equivalent or superior to that of Teflon FEP.

REMARKS: The objective of this contract was the evaluation of polymeric materials potentially usable to construct expulsion membranes for storable liquid propellants such as nitrogen tetroxide and hydrazine.

8. Liquid Propellant Information Agency (now Chemical Propulsion Information Agency)

LIQUID PROPELLANT MANUAL, LPIA-LPM-1, prepared by individual units during 1961. (Confidential segments not cited or abstracted here).

IDENTIFICATION OF MATERIALS: As cited herein.

BASIS OF EVALUATION: Varied according to contributor; but citations include adjective ratings.

REMARKS: This is a summarization of otherwise completed and reported work.

9. Aeronautical Systems Division, Wright-Patterson Air Force Base

THE COMPATIBILITY OF MATERIALS WITH CHLORINE TRI-FLUORIDE, PERCHLORYL FLUORIDE AND MIXTURES OF THESE. WADDTechnical Report 61-54, April 1961. Work by Pennsalt Chemicals Corporation; authors: J.C. Grigger and H.C. Miller, Contract: AF 33(616)-6796

#### **IDENTIFICATION OF MATERIALS:**

Polytetrafluoroethylene (Teflon)------The Garlock Packing Co. Teflon, CaF<sub>2</sub>-filled (25-35%) ------The Garlock Packing Co. Polychlorotrifluoroethylene (Kel-F) -------Walter B. Gallagher Co., Conshohocken, Pa.

BASIS OF EVALUATION: Weight loss; in terms of change.

REMARKS: This report contains a literature survey. All fluorinated plastics showed weight gains on exposure to each of the three test liquids. The observed slow release of this absorbed chlorine trifluoride and perchloryl fluoride could present a corrosion problem for equipment with Teflon or Kel-F packings, gaskets, etc, during standby or atmospheric exposure periods.

REF
11. (Continued)

IDENTIFICATION OF MATERIALS: None.

BASIS OF EVALUATION: None; general statements.

REMARKS: None.

12. Army Ballistic Missile Agency, Redstone

STUDIES ON U-DETA, by W.A. Riehl. ABMA Report RP-TR-2-60, 7 October 1960. Prepared by Engineering Materials Branch, George C. Marshall Space Flight Center, NASA, Huntsville.

IDENTIFICATION OF MATERIALS: Not formally or specifically identified.

BASIS FOR EVALUATION: From reported work and actual experiences.

REMARKS: U-DETA is a liquid composed of 60% (by weight) unsymmetrical dimethylhydrazine (UDMH) in diethylene triamine (DETA). This particular blend was used as the fuel in some of the Jupiter-C special mission missiles. The density and viscosity of this propellant were sufficiently similar to that of the alcohol-water fuel of the Redstone missile to permit substitution in the same propulsion hardware without appreciable redesign or modification. The report cited is a summary of the research and development studies which were done in order to provide a basis for safe and reliable use of U-DETA as a rocket propellant.

# REF 14. (Continued)

BASIS OF EVALUATION: Varied as to source.

REMARKS: This report is a compilation of interdepartmental communications containing materials compatibility information.

#### 14A. Bell Aerosystems Company

SUMMARY OF MATERIALS COMPATIBILITY WITH NITROGEN TETROXIDE, by A.E. Pepe. Report No. 8133-90200 Revision A, October 1962. Published and distributed under Contract AF 33(657)-8555

IDENTIFICATION OF MATERIALS: As cited.

BASIS OF EVALUATION: Materials with A rating are suitable for unrestricted use; a B rating indicates suitability for restricted applications; a C rating indicates limited resistance to corrosion; and a D rating is assigned to materials not recommended for use.

Rating:	Class A*	Class B	Class C	Class D
Volume change % Change in duro-	0 to +25 -	10 to +25 +10		<-10 or > +25 <-10 or > +10
meter reading Effect on Propellant	_	None	Slight	Severe
Visual Examination		No change	_	Dissolved, blistered or cracked

\* A 25 percent volume swell is not considered detrimental for a static seal, particularly when it is partially enclosed. However, materials which exhibit greater than 10 percent volume swell may cause excessive increases in frictional resistance or binding when used for dynamic seals.

REMARKS: An extensive survey of literature, laboratory results, and test data was conducted. On the basis of this survey, the specific characteristics of each material were defined and a compatibility rating is assigned to each.

15. Bell Aerosystems Company

ANALYTICAL CHEMISTRY, by Peter Yin and W. L. Clark. Report No. BLR 62-20 (C) Revision A, April 1963. Published and distributed under Contract AF 33(657)-8555

IDENTIFICATION OF MATERIALS: Teflon - Knowlton 071962-A-6; Dacron

BASIS OF EVALUATION: Physical appearance of material and of fluid propellant; weight loss.

REMARKS: None

"Titan II Propellant handling and compatibility problems", by O.C. Bender, (Martin Company). AIAA Space Flight Testing Conference, Cocoa Beach, Florida, 18-20 March 1963.

28. (Continued)

IDENTIFICATION OF MATERIALS: None specifically identified

\*\*\*\*\*\*\*

BASIS OF EVALUATION: General statements based on knowledge gained through experience, discussed in terms of most compatible, compatible for short term usage, and incompatible.

REMARKS: Significant progress has been made in recognizing and using compatible materials for the Titan II propellants. However, time and money could have been saved if the knowledge of material compatibility, especially in the area of nonmetallic seals, had been improved.

#### 29. Allied Chemical Corporation, Plastics Division

PLASKON, PLASTICS AND RESINS, Technical Data Report CTI-3, undated.

#### **IDENTIFICATION OF MATERIALS:**

Plaskon CTFE 2200; Plaskon CTFE 2300; Plaskon CTFE 2400; Plaskon CTFE 3200

#### BASIS OF EVALUATION:

Excellent: recommended for use; completely resistant.

Good: Recommended for use. Slight loss of properties, discoloration, or swelling after a long period of time. May not be safe at a more elevated temperature or higher concentration.

Poor: Not recommended for use. Slow attack, but the material is resistant for short periods of time.

Severe: Not recommended for use. Rapid chemical attack or solvation.

REMARKS: None

30. U.S. Air Force Space Systems Division, Edwards Air Force Base

NITROGEN TETROXIDE HANDLING MANUAL. AF/SSD-TR-61-8, September 1961. Prepared by Rocketdyne, Contract AF 33(616)-6939.

IDENTIFICATION OF MATERIALS: None, other than cited in Section 3.

BASIS OF EVALUATION: Straight listing of materials <u>compatible</u>, limited service, and incompatible.

REMARKS: This manual presents directly usable information for the safe handling of nitrogen tetroxide. (See Ref 22, "Remarks").

31. Picatinny Arsenal, Ammunition Engineering Directorate

THE COMPATIBILITY OF ADVANCED PACKAGEABLE ROCKET PROPELLANTS WITH MATERIALS OF CONSTRUCTION, by J.D. Clark, A.E. Boyce and S.P. Mobley. Technical Report 3115, October 1963.

IDENTIFICATION OF MATERIALS: None, as to identification of specific source.

BASIS OF EVALUATION:: General statements based on change in weight resulting from exposure at controlled temperatures.

REMARKS: The object of the investigation was to determine what materials of construction are compatible with the rocket propellants chlorine trifluoride and Hydrazoid P for extended periods of time.

32. NASA, George C. Marshall Space Flight Center

COMPATIBILITY OF MATERIALS WITH LIQUID OXYGEN, by C. F. Key and W.A. Riehl. MTP-P&VE-M-63-14, 4 December 1963.

IDENTIFICATION OF MATERIALS: Tabulations of data in this report include: "Material", "Manufacturer", and "Composition". Selection of data from this report was more controlled by the "Composition" than the other media of identification. Citations are by composition number. (See Appendix A, also)

BASIS OF EVALUATION: Data transcribed directly from source. This report, however, does provide functional evaluations, as follows:

- S Satisfactory for LOX service if cleaned and/or processed by applicable MSFC standards.
- BT Satisfactory as stated above, with the provisions that each manufacturer's batch of the product must be individually tested and found acceptable.
- C Conditional, insufficient test experience to rate sample adequately.
- U Unacceptable, capable of vigorous burning or exploding in contact with LOX.

REMARKS: In order to acceptance-test a material for use in LOX systems, twenty separate samples of the material submerged in LOX are subjected to 10 Kg-M (72 ft-lbs) impact energy delivered through a 1/2 inch diameter area. More than one indication of sensitivity is cause for immediate rejection. A single explosion, flash, or other indication of sensitivity during the initial series of twenty tests requires that an additional forty samples be tested without incident to insure acceptability of the material.

Two notes of caution are in order. (1) Wherever possible, a complete identification is made of the materials tested. Although some general conclusions can be drawn relative to certain classes or chemical families of materials, it is definitely unsafe to predict the behavior of any totally new product on this basis. Even materials normally inert to LOX can be rendered unsafe by minute amounts of processing additives, pigments, etc., that may be favored by one manufacturer or processor. It is equally unsafe to define a material for a specific application in liquid oxygen solely on the basis of a military or other specification for a general purpose product, since most such specifications do not limit sufficiently the chemical constitution of the product.

REF
33. U.S. Air Force, Aeronautical Systems Division (Wright-Patterson AFB)

HANDBOOK OF DESIGN DATA ON ELASTOMERIC MATERIALS USED IN AEROSPACE SYSTEMS, Technical Report No. ASD-TR-61-234, H January 1962. AD 273 880 (Prepared by Southwest Research Institute) authors: A.G. Pickett and M.M. Lemcoe.

IDENTIFICATION OF MATERIALS: None, other than cited in Section 3.

BASIS OF EVALUATION: None

REMARKS: This is a survey of the field, and information is taken from many sources. Thus, specific materials are not identified, and discussion of evaluation is general.

Of the great volume of data provided, only volume swell and LOX impact resistance were included here. Of the one, it is stated that volume swell data is suitable only for preliminary elastomer screening. A rule of thumb for evaluation is given:

Less than 16% - probably compatible Less than 40% - may be compatible Greater than 40% - incompatible

Concerning LOX impact resistance, this report states that it has no connection with the chemical or physical properties of most elastomers. Standard test measures the ability of the material to withstand an impact load in the presence of LOX. However, even an oily finger-print can cause the sample to undergo detonation.

In general, this report stresses caution in the interpretation of compatibility data for elastomers.

Compositions actually tested are further defined in the report

BASIS OF EVALUATION: Specific results given; no generalizations.

REMARKS: Elastomeric materials resistant to hydrazine, unsymmetrical dimethyl hydrazine and JP-X fuel mixture have been found for service at room temperature and 160°F. for immersion periods ranging from 21 days to 6 months. Among these is a new commercial polybutadiene elastomer. A semi-commercial elastomer resistant to n-proply nitrate up to 3 months at 160°F. has been found. Compounds which resist inhibited red fuming nitric acid up to 3 weeks at room temperature have been evaluated.

### REF (Continued)

Several flexible plastics have been found resistant to nitrogen tetroxide (3 months), inhibited red fuming nitric acid (3 weeks) at room temperature and liquid chlorine trifluoride at its boiling point (1 hour). No elastomers tested resisted nitrogen tetroxide or chlorine trifluoride.

### 35. U.S. Air Force Materials Laboratory (Wright-Patterson AFB)

THE COMPATIBILITY OF STRUCTURAL MATERIALS WITH HYBALINE A-5 and COMPOUND A. AFML Technical Report TR-64-391, December 1964. (By Pennsalt Chemicals Corporation; authors: J.C. Grigger and H.C. Miller. Contract AF 33(657)-8461.)

Koppers

American Cyanamid American Cyanamid

Dow Chemical

U.S. Polymeric

Cincinnati Testing Laboratory

Emerson & Cuming

BASIS OF EVALUATION: None; direct data

REMARKS: Literature survey indicated that very few of the resins commonly used in filament-wound structures possessed a high degree of compatibility with Aerozine 50, nitrogen tetroxide, pentaborane, or chlorine trifluoride. It was also noted that polymeric films were permeable to these fluids. Preliminary screening tests of the chemical compatibility of resins and liner materials confirm the literature reports and indicated the necessity for a barrier type liner. A metallic liner appears to be mandatory for the more corrosive propellants.

Resin systems:

Polyepoxide- Bisphenol A (Kopox 170/DER/BF<sub>3</sub>-400)

Phenol formaldehyde (U.S. Polymeric No. 46)

# REF 36A. (Continued)

Novolac epoxy (DEN 438/BF<sub>3</sub>-400) Polyepoxide (Kopox 170/BF<sub>3</sub>-400)

Liner films:

Teflon; Kynar; Polyethylene; Polypropylene

BASIS OF EVALUATION: None; direct data given.

REMARKS: Data was accumulated on the compatibility of resins and liner materials with rocket fuels and oxidizers at two temperatures and over extended time periods.

### 36B. Aerojet-General Corporation, Von Karman Center

EXPLORATORY EVALUATION OF FILAMENT-WOUND COMPOSITES FOR TANKAGE OF ROCKET OXIDEIZERS AND FUELS. Contract AF 33(615)-1671; QPR 0873-01-3, March 1965. For: Air Force Materials Laboratory. AD 462 840.

### **IDENTIFICATION OF MATERIALS:**

Composites (with S-HTS glass):	content		
Phenol formaldehyde (U.S. Polymeric No. 46)	20.5%		
Novolac epoxy (DEN 438/BF <sub>3</sub> -400)	19.8%		
Polyepoxy (Kopox 170/BF <sub>3</sub> -400)	18.8%		

### Liner films:

Teflon; Kynar; Polyethylene; Polypropylene

BASIS OF EVALUATION: None; direct data given.

REMARKS: Preliminary data and information on the effects of propellants and a simulated space environment on glass reinforced composites are presented. The results of these studies are reviewed to provide a basis for the selection of materials to be used.

REF

36C. Air Force Materials Laboratory (W-P AFB)

EXPLORATORY EVALUATION OF FILAMENT-WOUND COMPOSITES FOR TANKAGE OF ROCKET OXIDIZERS AND FUELS, By M. J. Sanger, R. Molho and W.W. Howard (Aerojet-General Corporation). AFML-TR-65-381, January 1966. Contract AF 33(615)-1671.

### **IDENTIFICATION OF MATERIALS:**

Polyepoxide (Kopox 170 - Koppers)
Phenol formaldehyde (U.S. Polymeric)
Epoxy, novolac (Dow)
Teflon, (duPont)
Kynar (Pennsalt Chemicals)
Polyethylene (unidentified)
Polypropylene (unidentified)

BASIS OF EVALUATION: None, direct data given.

REMARKS: None of the resins evaluated in Phase I demonstrated complete compatibility with the propellants for extended exposures, but some resin systems were found that have moderate resistance. A novolac type epoxy resin was selected for use in the subscale tankage because of its favorable physical properties and chemical stability. In study of the liners, the fluorocarbons were found to be the most compatible with rocket fuels and oxidizers.

### 37. U.S. Air Force, Aeronautical Systems Division (Wright-Patterson AFB)

MECHANICALLY INITIATED REACTIONS OF ORGANIC MATERIALS IN MISSILE OXIDIZERS, Technical Report 61-324, October 1961. (Prepared by the Martin Company; authors: R. L. Hauser, G. E. Sykes, and W. F. Rumpel under Contract AF 33(616)-7271).

### **IDENTIFICATION OF MATERIALS:**

Acrylonifrile-butadiene copolymer Polyacetal Polybutadiene Goodrich, Hycar 1000x132 DuPont, Delrin Firestone, Diene

# REF (Continued)

IDENTIFICATION OF MATERIALS: (Cont)

Polychloroprene Du Pont, Neoprene WB Poly(cyanomethyl)siloxane General Electric

Polydimethylsiloxane
Polyethylene, 0. 92
Polyethylene, 0. 96
Polyisoprene
Polypropylene
Dow Corning
Spencer, 1504
Phillips, Marles 50
Firestone, Coral
Hercules, ProFax

Polystyrene Unior Carbide Poly(trifluoropropyl) Dow- Corning methysiloxane

Polyvinyl Chloride Union Carbide
Polyvinylidene fluoride Pennsalt, Kynar

Vinylidene fluoride-hexafluo- Du Pont, Viton A ropropylene

BASIS OF EVALUATION: None, direct data.

REMARKS: Pure polymers, plasticizers, and antioxidants were studied and their threshold sensitivity levels and detonation energies were determined. Procedures and equations for calibrating impact testing machines were developed and used to calculate the rates of energy transfer into test materials. A full record of test procedures is included.

### 38. New York Naval Shipyard, Materials Laboratory

THE SUITABILITY OF ELASTOMERIC MATERIALS FOR USE IN THE DEVELOPMENT OF HOSES, GASKETS, AND DIAPHRAGMS FOR HANDLING ROCKET PROPELLANTS, by J. Mirone v and A.D. Delman. Lab Project 5998-3, Final Report, 8 May 1959. NSSo33-200.

### **IDENTIFICATION OF MATERIALS:**

Hypalon S-2 --- Surety Rubber Company, Carrollton, Ohio Vistanex-Polyethylene coated Vinyon cloth --- Connecticut Hard Rubber Co. Butyl Rubber Gloves, unsupported --- Bond Rubber Company, Der

Butyl Rubber Gloves, unsupported --- Bond Rubber Company, Derby, Conn.

## REF (Continued)

IDENTIFICATION OF MATERIALS: (Cont) Polyethylene-Vistanex coated Fortisan --- Quartermaster R&D Center, Natick Butyl coated cotton airplane cloth (white and black) --- Chemical Rubber Products, Inc., Beacon, New York Boots, butyl rubber (Air Force handler's suit) --- Bristol Rubber Company, Bristol, Conn. Neoprene rubber (unknown) Kel-F Resin 800 and Kel-F Elastomer 5500 on Fiberglass 116DD --- M. K. Keilogg Company, Jersey City, N. J. Trithene A --- Visking Corporation, Chicago Teflon Coated Fiberglass --- E.I. duPont deNemours & Co. Polyethylene, clear and black, on "Nygen" or nylon --- Texileather Division of General Tire and Rubber Company Armalon coated fabric --- E.I. duPont deNemours & Co. Butyl rubber - Vistanex Compound No. 8 --- Chemical and Radiological I boratory, Army Chemical Center

BASIS OF EVALUATION: None, direct observation as reported.

REMARKS: Thirty-two different elastomeric materials were investigated to determine their potential suitability for use in the fabrication of hoses, gaskets, and diaphragms necessary for shipboard handling and storage of red fuming nitric acid and mixed-amines. Results indicate that a fluorinated polymer is suitable for prolonged use with red fuming nitric acid. All of the materials are unsatisfactory for applications requiring prolonged contact with mixed-amines. Three specimens are suitable for short term use with red fuming nitric acid, while six of the elastomeric materials are suitable for interim use with mixed-amines.

39. Defense Metals Information Center, Battelle Memorial Institute

COMPATIBILITY OF MATERIALS WITH ROCKET PROPELLANTS AND OXIDIZERS. DMIC Memorandum 201, 29 January 1965.

IDENTIFICATION OF MATERIALS: As specified in individual transcriptions.

REF (Continued)

BASIS OF EVALUATION: Ratings for nonmetals are also somewhat arbitrary but wherever possible they follow those described in the Titan II Storable Propellant Handbook. (Ref 4) The classifications are:

		Class		
	1	2	3	4
Volume Change, percent	0 to +25	-10 to +25	~10 to +25	<-10 or>+25
Durometer Reading Change	l- <u>+</u> 3	<u>+</u> 10	<u>+</u> 10	< -10 or> +10
Effect on Propel	l- None	Slight change	Moderate change	Severe
Visual Examina- tion	- No change	Slight change	Moderate change	Severly blis- tered, or cracked, dis- solved
General Usage	Satisfac- tory use	Satisfactory for repeated short term use	Satisfactory for short time use	Unsatisfactory

REMARKS: This memorandum summarizes the available information on the compatibility of liquid rocket propellants with prominent materials of construction. It is pointed out that compatibility data for materials not ordinarily covered by the Defense Metals Information Center are included. These data were found during the search for information on materials that are within the scope of the DMIC, and are included for convenience. Fuels and oxidizers of current interest are discussed. The corrosion data which are presented will apply to storing, handling, and control equipment outside of missiles and to missile components excluding combustion chamber. The compatibility of materials with reaction products in combustion chambers, nozzles, etc., has not been considered. Included in the summary are data for many nonmetallic materials. These data were collected in conjunction with those obtained for metals but no concerted effort was made to secure compatibility data for nonmetals.

### 40. National Aeronautics and Space Administration

TECHNOLOGY SURVEY: ADVANCED VALVE TECHNOLOGY, NASA SP-5019, February 1965. Prepared by Midwest Research Institute; K.D. May, author.

# REF 40. (Continued)

IDENTIFICATION OF MATERIALS: None other than individually stated.

BASIS OF EVALUATION: The classification code used is the same as the one used in the Bell Handbook (See Reference 4, this report).

REMARKS: In considering the compatibility of valve materials with propellants, many propellants of current interest for space application are taken into account. Consideration is given only to the materials that would be subjected to the propellant environment for long-term duration, or as would be experienced by the valves operating in industrial processes, storage facilities, transportation equipment, or on a space vehicle in an extended orbit of approximately two years. In general, materials that are considered acceptable are rated according to corrosion and impact tests that have been performed.

The materials selected as compatible with a given propellant are intended to be used as a guide to the valve designer. Disagreement in ratings of some materials by different sources of information may have resulted from inadequate test procedures, isolated adverse effects due to improper cleaning, etc. In many cases temperatures given are only test temperatures and are not necessarily limit temperatures needed to maintain an acceptable rating.

### 41. Tripartite Technical Cooperation Program

Statement: Minutes of the Eleventh Meeting of Working Panel, P-3; Sub-Group TTCP. Held at Canadian Armament Research and Development Establishment, Valcartier, Quebec. 26-28 October 1965.

IDENTIFICATION OF MATERIALS: Not specific, other than stated.

BASIS OF EVALUATION: Statement of Mr. Kelble, U.S. Air Force.

REMARKS: (Transcript of statement as reported by J. Matlack, Picatinny Arsenal, 13 December 1965, Travel report.)

## REF

41. (Continued)

REMARKS: (Cont)

Mr. Kelble (USAF) spoke of the nitroso terpolymers cured with chromiumtrifluoroacetate catalyst which results in an elastomer compatible with  $N_20_4$ . The nitroso elastomer in an unstressed state remained unaffected after 90 days in contact with  $N_204$  at  $160^{\circ}$ F. The best butyl rubber, previously available, had a life of only 1 or 2 days under similar conditions. Prototype expulsion bladders, hose, seals and protective clothing are being developed as well as coating for metals. He reported on a Viton type fuel tank sealant which remains in satisfactory condition for 1000 hours at  $500^{\circ}$ F and for 500 hours at  $550^{\circ}$ F. It is a room temperature curing compound, with 80 to 85% solids content, requires no primer and has good adhesion to titanium and stainless steel.

### 42. Union Carbide Corporation, Linde Division

COMPATIBILITY OF MATERIALS WITH 7500 PSI OXYGEN, by G.J. Nihart and C.P. Smith. Aerospace Medical Research Laboratories report AMRL-TDR-64-76, October 1964. Contract AF 33(657)-11686.

### **IDENTIFICATION OF MATERIALS:**

Teflon (Virgin TFE) - E.I. duPont de Nemours and Company, Inc. Teflon 100X (FEP) - E.I. duPont de Nemours and Company, Inc.

Viton A(Virgin) - E.I. duPont de Nemours and Company, Inc.

Viton B (Virgin) - E.I. du Pont de Nemours and Company, Inc.

Rulon A (Reinforced TFE) - Dixon Corporation

Rulon B (Reinforced TFE) - Dixon Corporation

Rulon C (Reinforced TFE) - Dixon Corporation

Duroid 5600 (60% Teflon, 40% aluminum silicate ceramic fibers) - Rogers Corporation

Duroid 5650 (75% Teflon, 25% aluminum silicate ceramic fibers) - Rogers Corporation

Duroid 5870 (85% Teflon, 15% glass fibers) - Rogers Corporation

Duroid 5813 (60% Teflon, 40% glass fibers with MoS<sub>2</sub> filler) -

Robers Corporation

Kel-F 81 (CTFE) - Minnesota Mining and Manufacturing Company Kel-F Elastomer 3700 - Minnesota Mining and Manufacturing Company

Kel-F-Elastomer 5500 - Minnesota Mining and Manufacturing Company

BASIS OF EVALUATION: No special basis; data reported.

## REF

42. (Continued)

REMARKS: This program was conducted to develop ignition data on thread lubricants, thread sealants, fluorocarbon plastics, and metals. Spontaneous ignition temperatures were determined in both 2000 psi and 7500 psi oxygen for all the above materials. The spontaneous ignition temperatures for these materials were found to be essentially the same in 7500 psi oxygen and in 2000 psi oxygen. Glass-filled polytetrafluoroethylene is usable only if tightly confined.

South De .

## 43. Thiokol Chemical Corporation, Reaction Motors Division

Work on Contract AF 33(657)-11093; N. B. Levine, J. Green, W. Sheehan; reported in CHEMICAL AND ENGINEERING NEWS, 14 February 1966.

IDENTIFICATION OF MATERIALS: Carboxylnitroso terpolymer (cured with metals salts of organix and fluorocarbon acids), epoxy compounds, and epoxy-metal oxide mixtures.

BASIS OF EVALUATION: Not given. Work involved total immersion.

REMARKS: Using a terpolymer containing 1.25 mole % perfluoronitrosobutyric acid, the group prepared several vulcanates containing from 0.5 to 10 parts by weight of chromium trifluoroacetate per hundred parts of carboxy nitroso rubber. The vulcanizates also contained 20 parts per hundred of rubber or Silstone 110 (10% silicone oil coated silica) as filler. Each was cured for 60 minutes at 200 F and oven postcured for six hours, stepwise, up to 300 F.

Much has been published on the su	bject of the cor	npatibi	lity of plastics with		

Much has been published on the subject of the compatibility of plastics with liquid propellants, fuels and oxidizers, but invariably from the standpoint of the propellant or fuel. This report is a rearrangement of the published compatibility data from the standpoint of the plastic material. It is in the form of a tabulation, with primary arrangement by plastic (or elastomeric) material; and thereunder, by fuel. All arrangements are alphabetical, in the form given in the original reference; that is, either by generic or trade designation. The compatibility evaluation is in terms of the original document, briefly culled to show behavior of the material at a given temperature and for a given time. Elastomers are included (although they are not a stated concern of PLASTEC); but oils, lubricants and greases are omitted, even though based on polymers. The information has been drawn from 43 references, which are annotated so that the information extracted from them shall have additional significance.

- 1. ORIGINATING ACTIVITY: Enter the name and address of the contractor, subcontractor, grantee, Department of Defense activity or other organization (corporate author) issuing the report.
- 2a. REPORT SECURITY CLASSIFICATION: Enter the overall security classification of the report. Indicate whether "Restricted Data" is included. Marking is to be in accordance with appropriate security regulations.
- 2b. GROUP: Automatic downgrading is specified in DoD Directive 5200.10 and Armed Forces Industrial Manual. Enter the group number. Also, when applicable, show that optional markings have been used for Group 3 and Group 4 as authorized.
- 3. REPORT TITLE: Enter the complete report title in all capital letters. Titles in all cases should be unclassified. If a meaningful title cannot be selected without classification, show title classification in all capitals in parenthesis immediately following the title.
- 4. DESCRIPTIVE NOTES: If appropriate, enter the type of report, e.g., interim, progress, summary, annual, or final. Give the inclusive dates when a specific reporting period is covered.
- 5. AUTHOR(S): Enter the name(s) of author(s) as shown on or in the report. Enter last name, first name, middle initial. If military, show rank and brarch of service. The name of the principal author is an absolute minimum requirement.
- 6. REPORT DATE: Enter the date of the report as day, month, year, or month, year. If more than one date appears on the report, use date of publication.
- 7a. TOTAL NUMBER OF PAGES: The total page count should follow normal pagination procedures, i.e., enter the number of pages containing information.
- 76. NUMBER OF REFERENCES. Enter the total number of references cited in the report.
- 8a. CONTRACT OR GRANT NUMBER: If appropriate, enter the applicable number of the contract or grant under which the report was written.
- 85. &c. & 8d. PROJECT NUMBER: Enter the appropriate military department identification, such as project number, subproject number, system numbers, task number, etc.
- 9a. ORIGINATOR'S REPORT NUMBER(S): Enter the official report number by which the document will be identified and controlled by the originating activity. This number must be unique to this report.
- 96. OTHER REPORT NUMBER(S): If the report has been assigned any other report numbers (either by the originator or by the aponaor), also enter this number(s).

- 10. AVAILABILITY/LIMITATION NOTICES: Enter any limitations on further dissemination of the report, other than those imposed by security classification, using standard statements such as:
  - (1) "Qualified requesters may obtain copies of this report from DDC."
  - (2) "Foreign announcement and dissemination of this report by DDC is not authorized."
  - (3) "U. S. Government agencies may obtain copies of this report directly from DDC. Other qualified DDC users shall request through
  - (4) "U. S. military agencies may obtain copies of this report directly from DDC. Other qualified users shall request through
  - (5) "All distribution of this report is controlled. Qualified DDC users shall request through

If the report has been furnished to the Office of Technical Services, Department of Commerce, for sale to the public, indicate this fact and enter the price, if known.

- 11. SUPPLEMENTARY NOTES: Use for additional explana-
- 12. SPONSORING MILITARY ACTIVITY: Exter the name of the departmental project office or laboratory sponsoring (pering for) the research and development. Include address.
- 13 ABSTRACT Enter an abstract giving a brief end factual summary of the document indicative of the report, even though it may also appear elsewhere in the body of the technical report. If additional space is required, a continuation sheet shall be attached.

It is highly desirable that the abstract of classified reports he inclassified. Each paragraph of the abstract shall and with an indication of the military security classification of the information in the paragraph, represented as (75), (5), (C), or (U)

There is no limitation in the length of the abstract. However, the auggested length is from 150 to 225 words.

14 KEY BORDS. Key words are technically meaningful terms or short phrases that characterize a report and may be used as index entries for cataloging the report. Key words must be selected so that no security classification is required. Identiers, such as equipment model designation, trade name, military power's code name, generaphic location, may be used as less words but will be followed by an indication of technical context. The assignment of links rules, and weights is ontoned.

Report 9 AD 294 117	REDUCTION OF REFLECTIVITY FROM TRANSPARENT MATERIALS: A MEMORANDUM IN EVALUATION OF TECHNIQUES APPLICABLE TO PLASTIC HELICOPTER CANOPIES, by Norman E. Beach, July 1962	
Report 10 AD 284 629	A SURVEY OF FILAMENT WINDING MATERIALS, DESIGN CRITERIA, MILITARY APPLICATIONS, by Allen M. Shibley, Harvey L. Peritt and Merrill Elg. May 1962	
Report 11 AD 282 795	SUBJECT INDEX, BIBLIOGRAPHY, AND CODE DESCRIPTION OF TECHNICAL CONFERENCE PAPERS ON PLASTICS: 15 FEBRUARY 1961 - 23 FEBRUARY 1962, by Arnold E. Molzon, June 1962	\$1.50
Report 12 AD 288 682	EFFECTS OF THE SPACE ENVIRONMENT ON PLASTICS: A SUMMARY WITH ANNOTATED BIBLIOGRAPHY, by Arthur H. Landrock, July 1962	\$2.25
Report 13 AD 431 603	FLUDIZED-BED COATING WITH PLASTICS: TECHNOLOGY AND POTENTIAL FOR MILITARY APPLICATIONS, by Arthur H. Landrock, January 1964	\$3,50
Report 14 AD 423 560	SUBJECT INDE (, BIBLIOGRAPHY, AND CODE DESCRIPTION OF TECHNICAL CONFERENCE PAPERS ON PLASTICS: 10 FEBRUARY 1962 - 10 FEBRUARY 1963, by Arnold E. Molzon, August 1963	\$2,50
Report 15 AD 601 391	A REVIEW OF PLASTICS FOR TOOLING: MATERIALS, TECHNIQUES, TOOL DESIGN, by Nicholas T. Baldanza, March 1964	\$3.06
Report 16 AD 605 396	PLASTIC GEARS: A MEMORANDUM ON FEASIBILITY FOR USE IN AMMUNITION ITEMS, by John Nardone, July 1964	\$1.00
Report 17 AD 606 561	SUBJECT INJEX, BIBLIOGRAPHY, AND CODE DESCRIPTION OF TECHNICAL CONFERENCE PAPERS ON PLASTICS: 28 Feb. 1983 - 1 Mar. 1964 by Arnold E. Molzon, July 1964	\$21.50
Report 18 AD 609 526	GLASS/RESIN INTERFACE PATENT SURVEY, PATENT LIST, AND GENERAL BIBLIOGRAPHY, by William J. Eakins, September 1964	\$1.25
Report 19 AD 457 593	FILAMENT WINDING BIBLIOGRAPHY. EVALUATED AND ANNOTATED, by Allen M. Shibley, December 1864	•
Report 20 AD 463126	PROPERTIES OF PLASTICS AND RELATED MATERIALS AT CRYOGERIC TEMPERATURES, by Arthur H. Landrock July 1965	• • •
Report 21 AD 620142	SUBJECT INDEX, BIBLIOGRAPHY, AND CODE DESCRIPTION OF TECHNICAL CONFERENCE PAPERS ON PLASTICS: 2 MARCH 1964 - 5 MARCH 1965, by Joan B. Titus and Arnold E. Molzon, June 1965	\$2.50
Report 22 AD 472712	A REVIEW OF NONDESTRUCTIVE TESTING FOR PLASTICS: METHODS AND APPLICATIONS, by Nicholas T. Baldanza, August 1965	• • •
Report 23 AD 624 922	ELECTRICAL PROPERTIES OF PLASTIC MATERIALS; DATA COMPILED FROM TECHNICAL CONFERENCE SEARCH, by Arnold E. Molzon, July 1965	\$5,00
teport 24	WEATHERING OF GLASS REINFORCED PLASTICS, by George R. Rugger and Joan B. Titus, January 1966	\$5.00
Tote 1 LD 261 550	THE APPLICATION OF NONDESTRUCTIVE TESTING TO PLASTICS, by Alfred M. Anzalone, July 1961	\$1.25
late 2 LD 268 266	INDEXED REFERENCES PERTAINING TO DEGRADATION AND FRACTURE OF PLASTICS, by Arnold E. Molzon, August 1961	\$1,60
lote 3	DEFENSE SPECIFICATIONS AND STANDARDS FOR AND RELATING TO REINFORCED PLASTICS, by Norman E. Beach, March 1963	\$0,50
AD 402 225 lote 4 AD 275 832	PLASTICS IN THE MEDICAL INDUSTRY: A CROSS-INDEXED BIBLIOGRAPHY, by Arnold E. Molzon, March 1962	\$1.25
iote 5	HEALTH HAZARDS AND TOXICITY OF PLASTICS: A CROSS-INDEXED BIBLIOGRAPHY by Arnold E. Molzon, March 1962	\$0.75
D 276 001 lote 6	GOVERNMENT: STOREST FROSS AND STANLAR OF OR PLUSTICS, COVERING DEFENSE ENGINEERING MATERIALS AND APPLICATIONS, 55 Not 2011 Output, May 1905	\$1.75
D 410 401 ote 7	LITERATURE SURVEY ON THERMAL DEGRADATION, THERMAL OXIDATION AND THERMAL ANALYSIS OF HIGH	\$2.75
D 423 546 ote 8	POLYMERS, by David W. Levi, June 1963 FILAMENT WINDING IN MILITARY APPLICATIONS, A DISCUSSION OF PROBLEMS ASSOCIATED WITH FILAMENT PROPERTY OF THE PROPERTY OF	\$1.00
D 425147 ote 9	WOUND MOTOR CASES, by Allen M. Shibley, September 1963 TRADE DESIGNATIONS OF PLASTICS AND RELATED MATERIALS, by Joan B. Titus and Norman E. Beach, December 1965	
ote 10	LITERATURE SURVEY ON THERMAL DEGRADATION, THERMAL OXIDATION, AND THERMAL ANALYSIS OF HIGH POLYMERS, by Dorothy A. Teetsel and David W. Levi, January 1966	\$4.00
